

OG LAYING MEAL / OG LAYING GRAIN

Supplementary feed for laying hens (without genetic engineering)

- Club OG laying meal as structured meal and Club OG laying grain as pellet are supplementary feeds - without genetically modified components.
- The combined feeding of laying meal / laying grain with your own grain or pick-pick grain feed results in a complete ration.
- In this way you can ensure that your laying hens are supplied with the feed they need for sustainable laying.
- Both feeds are VLOG-certified and are therefore suitable for the production of GMO-free food.

Please note that the products of our Club brand are only available from certain retailers - mainly in southern Germany. You can recognise them in the dealer search by the Club brand logo.

Ingredients

Crude protein	20,00 %
Crude fat	4,00 %
Crude fibre	2,70 %
Crude ash	17,50 %
Lysine	1,05 %
Methionine	0,45 %
Calcium	5,50 %
Phosphorus	0,60 %
Sodium	0,30 %
Energy	10.20 MJ ME/kg

Vitamins

Vitamin A	14.900.00 I.U./kg
Vitamin D3	3.600.00 I.U./kg
Vitamin E	30.00 mg/kg

For individual values, there may be slight deviations in content between the supplier plants.

Trace elements

contain other trace elements

For individual values, there may be slight deviations in content between the supplier plants.

Feeding recommendation

Supplementary feed for laying hens.

Feed in a ratio of 2:1 with pick-pick grain feed or cereals two weeks before and during the laying period. Towards the end of the laying period (shortly before moulting) and also generally for older laying hens, supplementary feeding of oyster shells in a separate feed container can be useful.

Ideally, OG laying meal / OG laying grain is fed in the morning before budding and grain feed in the evening. The daily requirement for a modern laying hen (hybrid with approx. 1.5 kg body weight) is approx. 120 grams per bird and day. This means 80 g OG laying meal / OG laying grain plus 40 g grain feed per bird and day.

Always provide fresh drinking water.
